PlatformIO

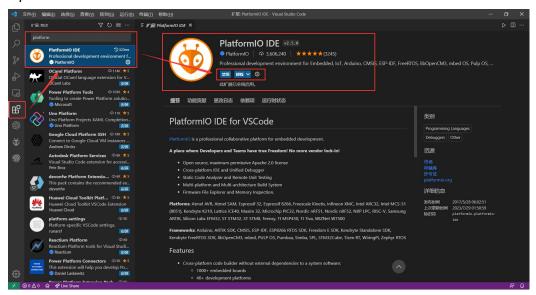

WZ2432R024 or WZ2432R028 or WZ2432R035

Take the WZ2432R024 as an example

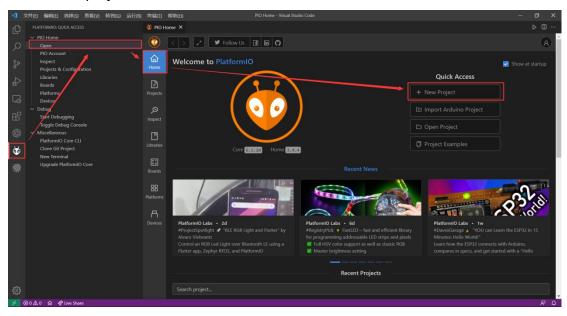

First open the VScode to check if the python is installed

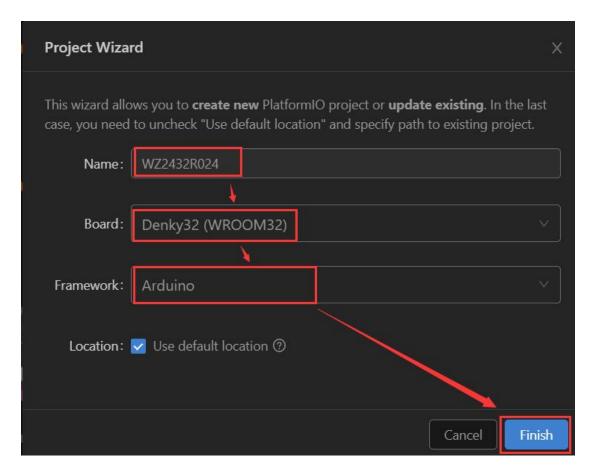

Open the VScode to download the PlatformIO

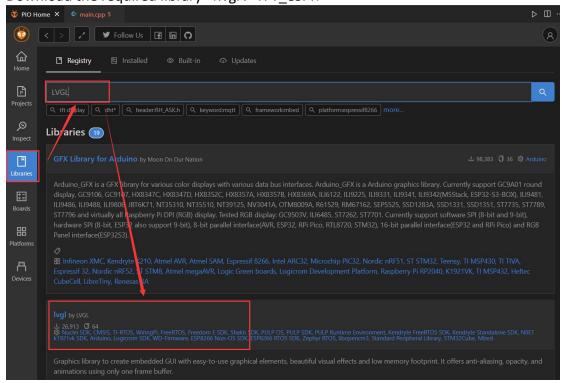

Create new projects

Download the required library (lvgl、TFT eSPI)

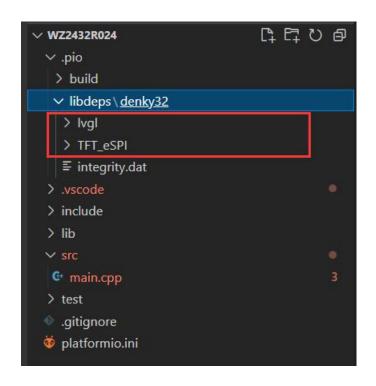

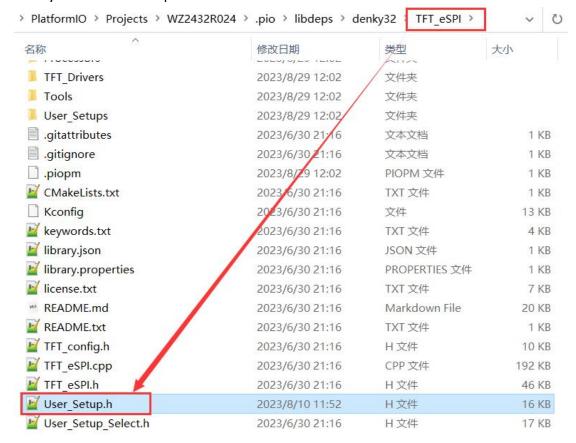

We can see that the library has been added successfully!

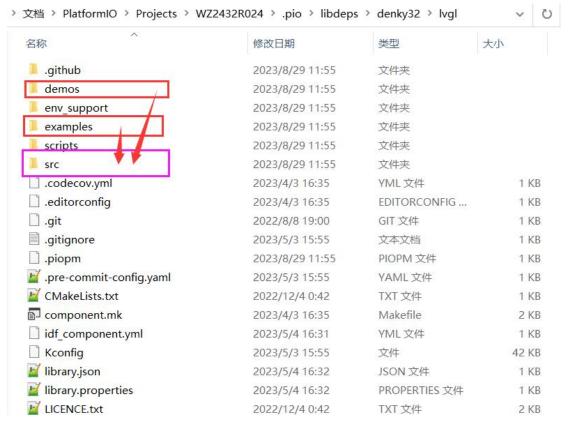

Next, we want to configure the TFT _ eSPI library to replace the User_Setup.h in the library with the file we provide

Next, we want to configure the lvgl library, right-click to open the folder directory, and put the demo and examples folders into the src folder!

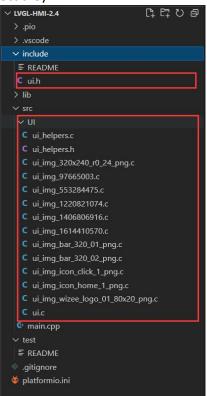

Place the lv_conf.h file under this directory again

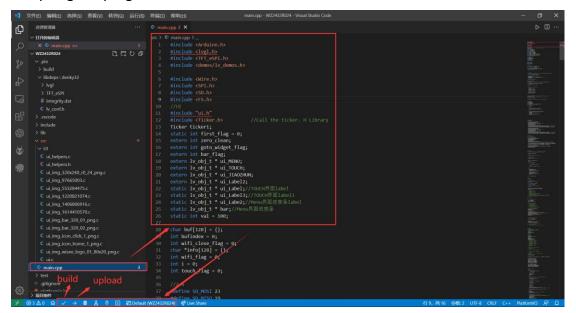

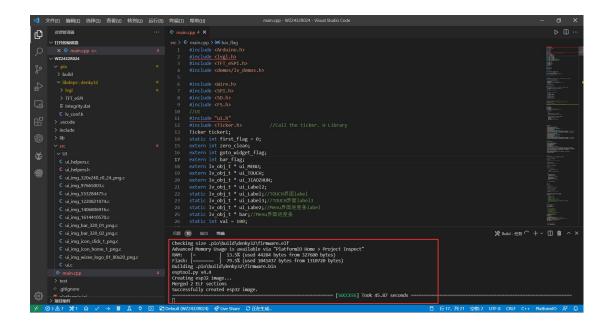

Next, let's configure our own UI files (the UI files are generated from the SquareLine Studio)

In the UI folder that will be generated. The c file is placed in the /src folder, and in the generated UI folder. Place the h file in the /include folder

At this time, we will complete all the configuration, write the code and start compiling the program

Next we began to burn the program, finished!
